MOHAN BABU UNIVERSITY

DATA SCIENCE LAB — SAMPLE EXPERIMENT

Experiment: Python Basics

Student Name: _____

Student ID: _____

Date: _____

Aim

To practice variables, data types, operators, conditional statements, loops, and functions in Python.

Requirements

Python 3.x or Google Colab.

Experiment

1. Create variables storing a student's name, roll number, and marks in three subjects.
2. Display the data types of each variable using type().
3. Calculate total marks and average using arithmetic operators.
4. Use if/elif/else to print a grade based on the average. Clearly define your grade ranges.
5. Use a loop to print numbers from 1 to 10 and their squares.
6. Write a function that accepts three marks and returns the average.
7. Call the function and display the result.

Expected Output

The program displays variable types, total and average marks, a grade, a sequence of squares, and the function result.

Conclusion

Write 3–4 sentences describing what you learned.

Note: This is a sample practice lab experiment created for learning and website testing. It is not an official university-issued lab manual.
