Study Guide: Data Science Fundamentals

Revision guide | Sample material

Key terms

- Dataset: a collection of related records.
- Feature: an input variable used in analysis or modeling.
- Target: the value a supervised model tries to predict.
- Training set: data used to fit a model.
- Test set: data reserved to estimate performance.

Revision questions

- Differentiate structured and unstructured data.
- Why should duplicate records be checked?
- What is the purpose of a train-test split?
- Explain the difference between classification and regression.
- Why is data visualization useful before modeling?

Quick study plan

- Review terms for 10 minutes.
- Answer the revision questions without notes.
- Practice one small data-cleaning example.
- Summarize the topic in your own words.
